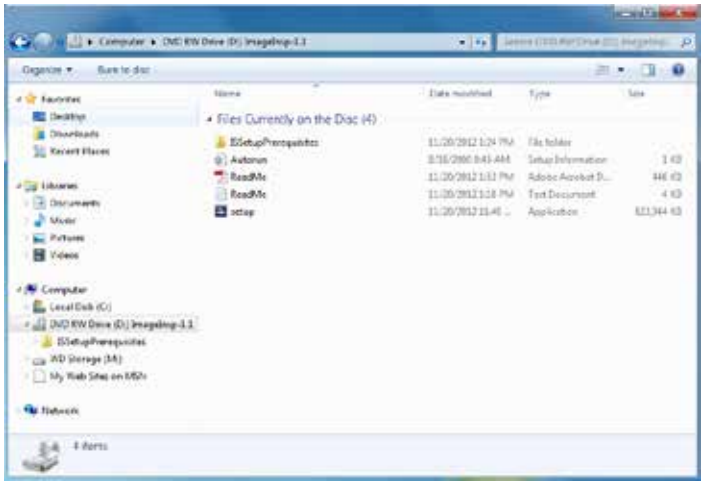
System Requirements

It is highly recommended that the computer being used for ImageInspector™ have at least 2GB of RAM. This is due to working with images.

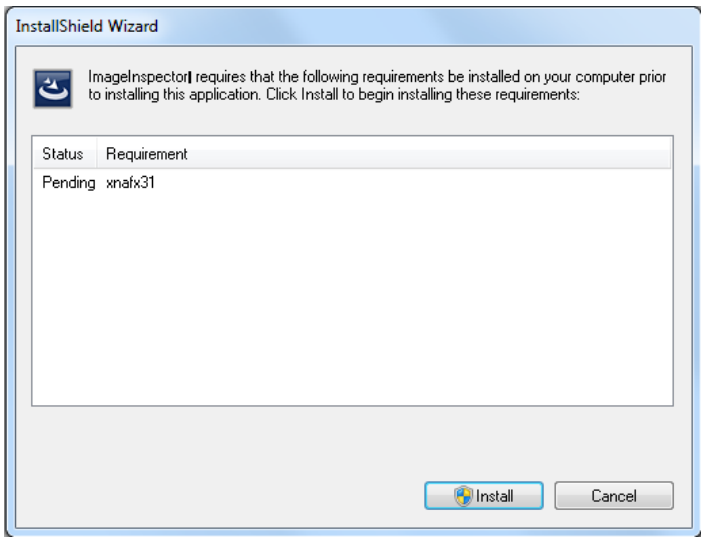
Installation

The install should start from the CD. If it does not start, navigate to the "setup" file on the CD and double-click it.

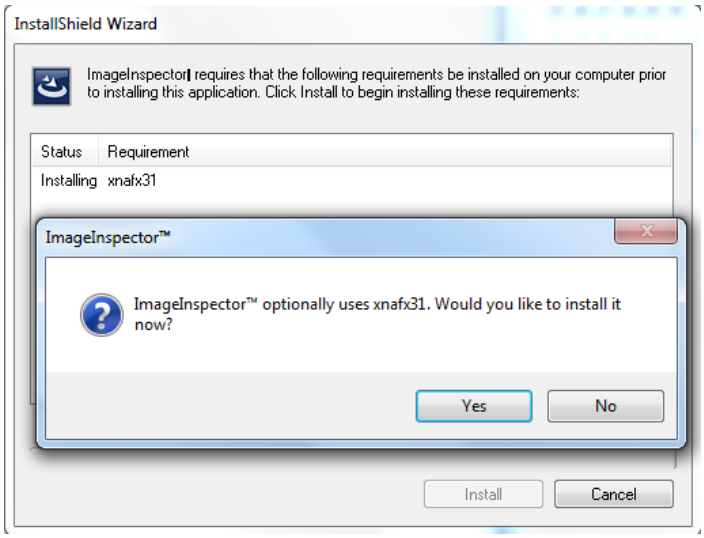
Note: there is a folder called "ISSetupPrerequisites" on the CD. The user need not access it. If files are needed the install will access them automatically.



ImageInspector™ requires the installation of Microsoft XNA Framework Redistributable 3.1. The framework is included with the ImageInspector™ install and will be installed or updated before ImageInspector™ installs.



Click Install to begin installation of the XNA Framework and “Yes” on the popup form.



The “Welcome to Microsoft XNA Framework...” form will open. Click Next to start the install.

Microsoft XNA Framework Redistributable 3.1 Setup
Welcome to the Microsoft XNA Framework Redistributable 3.1 Setup Wizard
The Setup Wizard allows you to change the way Microsoft XNA Framework Redistributable 3.1 features are installed on your computer or to remove it from your computer. Click Next to continue or Cancel to exit the Setup Wizard.

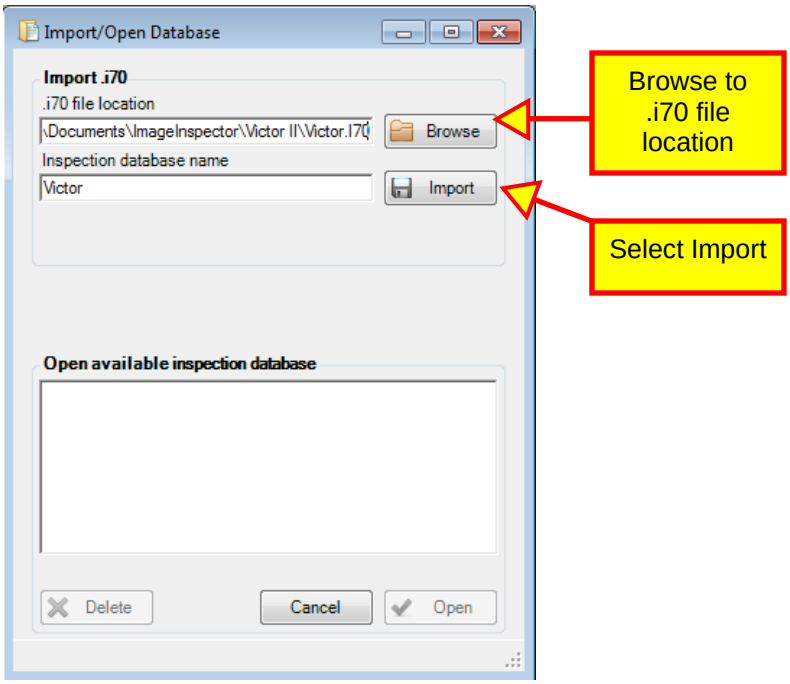
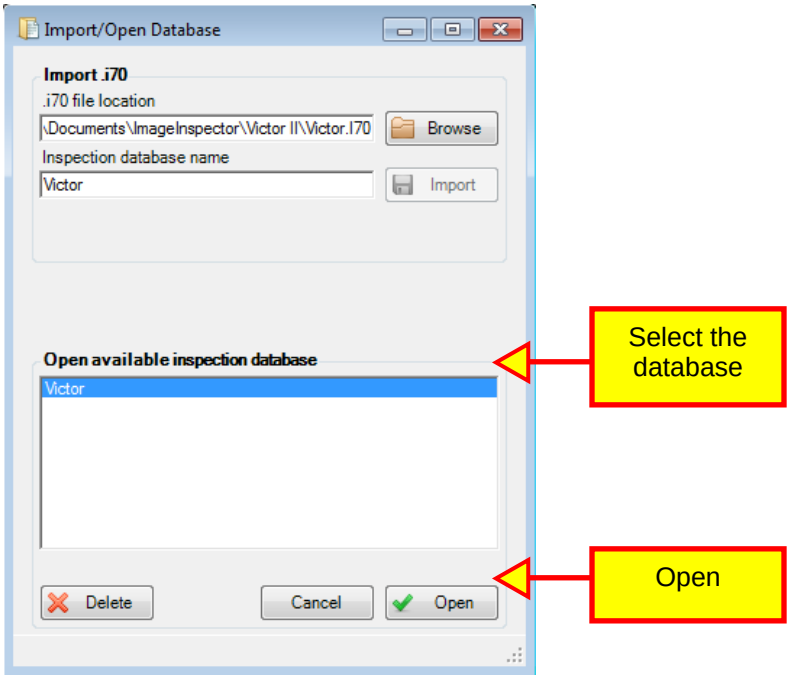
Import/Open Database:

Use **PAVER™ 6.5/7.0** to create an inspection file (.i70). Select **Import/Open Database** in the **ImageInspector™** to use the file. **Browse** to the .i70 file location. This location will most likely be on an external drive. (**ImageInspector™** install comes with one sample .i70 for use with the **Workshops**, which is automatically installed in the **Documents** folder under **ImageInspector™.** It can be used and/or deleted as desired.)

The user can accept the **Inspection database name** or choose another; then, select **Import**.



The imported inspection will appear in the available database list and can now be opened by highlighting it and selecting **Open** or double-clicking on the file name.



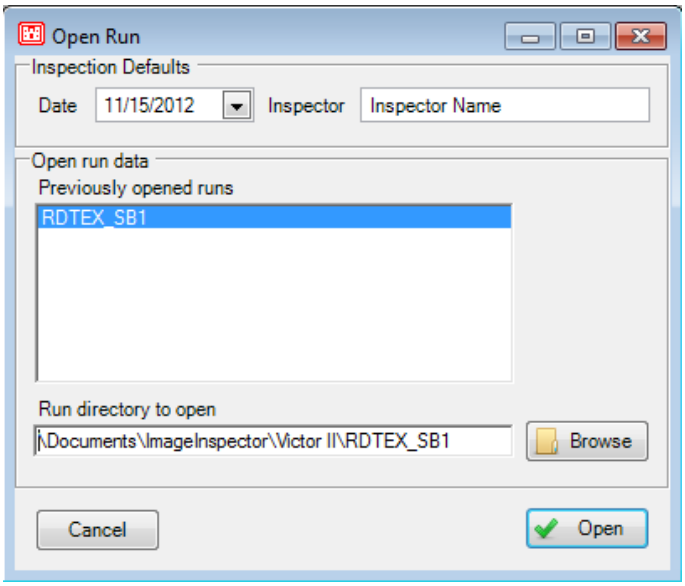
Once the database has been imported, **ImageInspector™** will keep it in the list of available databases so it will not have to be re-imported.

*Note: Work history and inventory items cannot be edited in **ImageInspector™**.

Open Run:

Select **Open Run** to be able to access the images you want for assignment and inspection. Use the **Browse** button to navigate to the directory containing the images and select **Open**. The directory will contain a file called **ImageInspector.DATA.mdb**, but it is the directory name that must be highlighted. Until a run is opened, all options except **Import/Open Database** and **Open Run** will be grayed out and inoperative on the **ImageInspector™ Button Bar**.

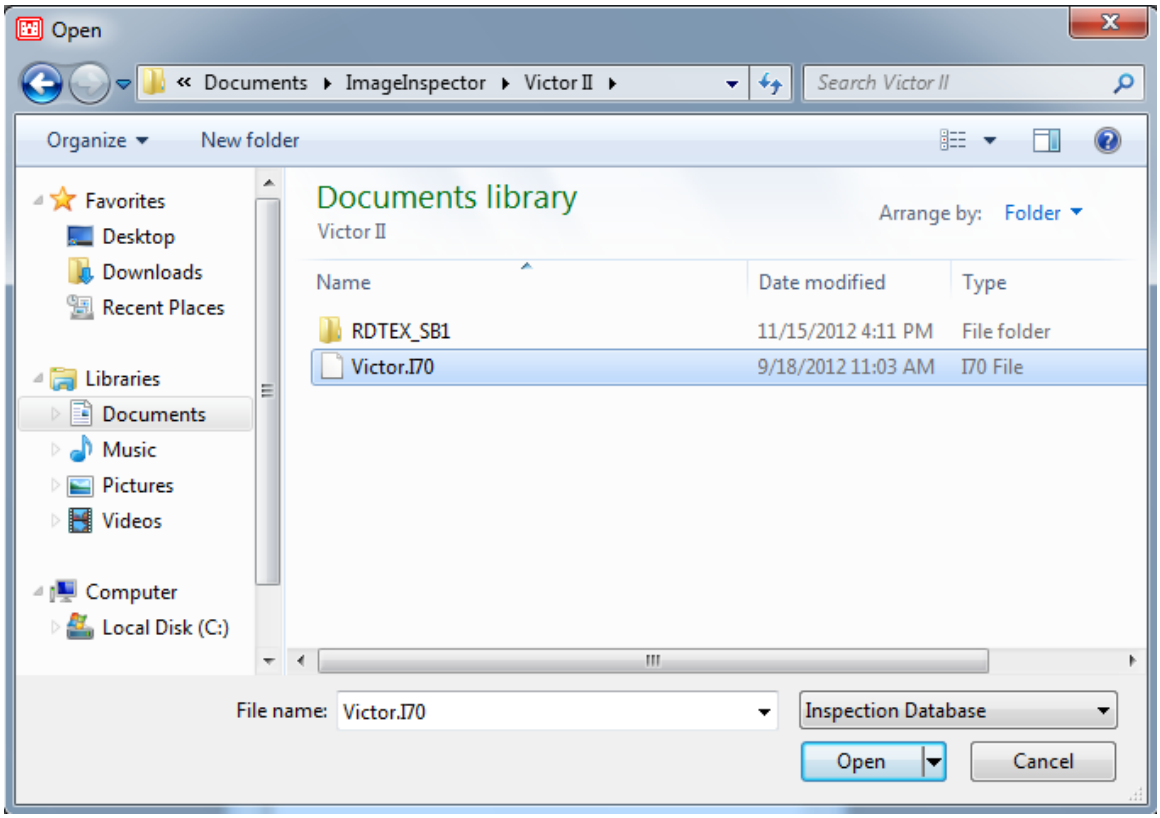
Once you have opened a run, **ImageInspector™** will keep it in the list of available runs. Please note that since image files are large and may be on external devices, the device will need to be connected and the path unchanged for **ImageInspector™** to access a previously opened run from the list. If the path is changed, the user will need to browse to the directory in its new location.



Sample Database:

A sample database for use with the Workshops has been included in the install.

For Windows 7 and Vista users, it is located at: C:\Documents\ImageInspector\Victor II.



For Windows XP users, it is located at: C:\Documents and Settings\All Users\Shared Documents\ImageInspector\Victor II.
